

# POWER BI PRESENTATION

# DASHBOARD

1. Total Sales: **\$189.48K**, with **15.05K** pizzas sold at an average price of **\$62.73**.
2. Top-selling pizzas: Hot Pepper, Chicken Suya, and BBQ Philly.
3. Lowest-selling pizza: Meatzaa.
4. Nevada has the **highest sales**, while Idaho has the **lowest**.
5. Sales **before** and **after** 9:00 AM are nearly equal (**50.4% vs. 49.6%**).
6. Sales **target** of **\$193.64K** per branch, but **actual performance varies**.
7. Total sales fluctuate, with a peak exceeding **\$25K** but mostly around **\$15K**.
8. **Need** : **Boost Idaho's performance** with promotions or special offers.
9. Consider **promoting low-selling pizzas** through discounts or combos.
10. Optimize time-based sales strategies for different customer segments.

# MAP VISUALIZATION

- California has a significant impact on sales and quantity, as removing it led to a notable decrease.
- Idaho contributes but at a lower level compared to California and Nevada.
- Nevada seems to have a strong contribution, as selecting it resulted in an increase in both sales and quantity.
- Oregon contributes moderately, with an impact between Idaho and California.
- Arizona is the main driver of sales & quantity but Nevada Shows a Slight Increase (1055 in Quantity)

# NUMERIC PARAMETER

- **Total Sales** (Orange) is significantly **higher** than both **Total Quantity** (Red) and **Total Profit** (Blue). This suggests that the **business is generating strong revenue from pizza sales**.
- **Hot Pepperoni Feast** has the **highest total sales**, making it the **best-selling pizza**. **Hot Veggie** and **Chicken Suya** also have **strong sales**, indicating their popularity.
- **Chicken Legend** and **Meatzaa** have the **lowest total sales**, meaning they are less popular or have lower demand. They might need marketing strategies or menu adjustments to improve performance.
- **Total Profit** (Blue) is **quite low compared to total sales**. This suggests that despite high sales, the profit margins on some pizzas may be low due to high costs of ingredients, promotions, or discounts.

# SALES FORECAST

**1. Actual Sales Trends:** The actual sales data shows fluctuations with peaks and valleys. There are notable increases and decreases, indicating a volatile sales trend. Around Day 15, there is a sudden drop, which serves as the transition point to forecasting.

**2. Forecasted Sales :** The black line represents predicted sales. The gray shaded area around the forecast represents the confidence interval (uncertainty range). The forecasted trend appears to be slightly declining or stabilizing, but the confidence interval suggests uncertainty in the predictions.

**3. Insights :** The declining forecast suggests that sales might decrease or remain steady in the upcoming days. The wide confidence interval indicates high uncertainty, meaning the forecast might have large variations. Understanding the reasons for previous fluctuations can help refine future predictions.
